

Version Control Standard:

For version control, we used Github. Branch naming convention was to start with the name of the module and include a .1 after the name. We increased the .1 each time the module was worked on until it was finished. The final module was pushed to the master branch with the original name and no decimals after.

Unit Testing:

For unit testing, we used C-Unit testing as taught in class. Each module was tested as it was worked on.

Automation Standard:

We used a standard makefile to automate the building and running of the program.

Programming Standard:

The chosen coding standard we used is located here:
